Abstract: - In this paper two model equations for shallow water waves and their extended models were considered. Adomian’s decomposition method (ADM) and variational iteration method (VIM) have been employed to solve them. Large classes of linear and nonlinear differential equations, both ordinary as well as partial, can be solved by the ADM. The decomposition method provides an effective procedure for analytical solution of a wide and general class of dynamical systems representing real physical problems. This method efficiently works for initial-value or boundary-value problems and for linear or nonlinear, ordinary or partial differential equations and even for stochastic systems. The variational iteration method (VIM) established in (1999) by He is thoroughly used by many researchers to handle linear and nonlinear models. Finally the results of ADM and VIM methods have been compared and it is shown that the results of the VIM method are in excellent agreement with results of ADM method and the obtained solutions are shown graphically.

Key-Words: - Adomian's decomposition method, Variational iteration method, shallow water waves

1 Introduction

Clarkson et.al [1] investigated the generalized short water wave (GSWW) equation

\[ u_t - u_{xxt} - \alpha u u_x - \beta u_x \int_0^x u_s dx + u_s = 0, \]  

(1)

where \( \alpha \) and \( \beta \) are non-zero constants. Ablowitz et al. [2] studied the specific case \( \alpha = 4 \) and \( \beta = 2 \) where Eq. (1) is reduced to

\[ u_t - u_{xxt} - 4uu_x - 2u_x \int_0^x u_s dx + u_s = 0, \]  

(2)

This equation was introduced as a model equation which reduces to the KdV equation in the long small amplitude limit [2, 3]. However, Hirota et al. [3] examined the model equation for shallow water waves

\[ u_t - u_{xxt} - 3uu_x - 3u_x \int_0^x u_s dx + u_s = 0, \]  

(3)

obtained by substituting \( \alpha = \beta = 3 \) in (1).

Equation (2) can be transformed to the bilinear forms

\[ \left[ \frac{1}{3} D_x (D_x + D_x^3) \right] f . f = 0, \]  

(4)

where \( s \) is an auxiliary variable, and \( f \) satisfies the bilinear equation

\[ D_x (D_x + D_x^3) f . f = 0, \]  

(5)

However, Eq.(3) can be transformed to the bilinear form

\[ D_x (D_x - D_x^2 + D_x) f . f = 0, \]  

(6)

where the solution of the equation is

\[ u(x,t) = 2(\ln f)_x, \]  

(7)

where \( f(x, t) \) is given by the perturbation expansion.
\[ f(x,t) = 1 + \sum_{n=1}^{\infty} \varepsilon^n f_n(x,t), \quad (8) \]

where \( \varepsilon \) is a bookkeeping non-small parameter, and \( f_n(x,t), \ n = 1, 2 \) are unknown functions that will be determined by substituting the last equation into the bilinear form and solving the resulting equations by equating different powers of \( \varepsilon \) to zero. The customary definition of the Hirota’s bilinear operators are given by

\[ D^n a.b = \left( \frac{\partial}{\partial t} - \frac{\partial}{\partial x} \right)^n a(x,t) b(x',t') \mid x' = x, t' = t. \quad (9) \]

Some of the properties of the \( D \)-operators are as follows

\[ \frac{D^2_{x_2} f.f}{f^2} = \int u_{_x} dx \, dx, \]
\[ \frac{D^3_{x_2} f.f}{f^2} = u_{_{x_3}} + 3u \int x u_{x} dx', \]
\[ \frac{D^5_{x_2} f.f}{f^2} = u, \]
\[ \frac{D^6_{x_2} f.f}{f^2} = u_{_{x_4}} + 15uu_{_{x_3}} + 15u^3, \quad (10) \]

Where

\[ u(x,t) = 2(\ln f(x,t))_{_{x_2}}, \quad (11) \]

Also extended model of Eq.(2) is obtained by the operator \( D^4_1 \) to the bilinear forms (4) and (5)

\[ \left[ D_x(D_1 + D^2_2 + D_3 + D^3_3) + \frac{1}{3} D_x(D_3 + D^3_3) \right] f.f = 0, \quad (12) \]

where \( s \) is an auxiliary variable, and \( f \) satisfies the bilinear equation

\[ D_x(D_3 + D^3_3)f.f = 0, \quad (13) \]

Using the properties of the \( D \) operators given above, and differentiating with respect to \( x \) we obtain the extended model for Eq. (2) given by

\[ u_x - u_{_{x_3}} - 4uu_x - 2u_x \int u_x dx + u_x + u_{_{x_3}} + 6uu_x = 0, \quad (14) \]

In a like manner, we extend Eq.(3) by adding the operator \( D^4_1 \) to the bilinear forms (6) to obtain

\[ D_x(D_1 - D_1 D^2_2 + D_3 + D^3_3)f.f = 0, \quad (15) \]

Using the properties of the \( D \) operators given above we obtain the extended model for Eq.(3) given by

\[ u_x - u_{_{x_3}} - 3uu_x - 3u_x \int u_x dx + u_x + u_{_{x_3}} + 6uu_x = 0, \quad (16) \]

In this paper, we use the Adomian’s decomposition method (ADM) and He’s variational iteration method (VIM) to obtain the solution of two considered equations above for shallow water waves. Large classes of linear and nonlinear differential equations, both ordinary as well as partial, can be solved by the ADM [4-9]. A reliable modification of ADM has been done by Wazwaz [10-12]. The decomposition method provides an effective procedure for analytical solution of a wide and general class of dynamical systems representing real physical problems [13-15]. This method efficiently works for initial-value or boundary-value problems and for linear or nonlinear, ordinary or partial differential equations and even for stochastic systems. Moreover, we have the advantage of a single global method for solving ordinary or partial differential equations as well as many types of other equations. The variational iteration method (VIM) [16-20] established in (1999) by He is thoroughly used...
by many researchers to handle linear and nonlinear models. The reliability of the method and the reduction in the size of computational domain gave this method a wider applicability. The method has been proved by many authors to be reliable and efficient for a wide variety of scientific applications, linear and nonlinear as well. The method gives rapidly convergent successive approximations of the exact solution if such a solution exists. For concrete problems, a few numbers of approximations can be used for numerical purposes with high degree of accuracy. The VIM does not require specific transformations or nonlinear terms as required by some existing techniques.

2 Basic idea of Adomian’s decomposition method

We begin with the equation

\[ Lu + R(u) + F(u) = g(t), \] (17)

where \( L \) is the operator of the highest-ordered derivatives with respect to \( t \) and \( R \) is the remainder of the linear operator. The nonlinear term is represented by \( F(u) \). Thus we get

\[ Lu = g(t) - R(u) - F(u), \] (18)

The inverse \( L^{-1} \) is assumed an integral operator given by

\[ L^{-1} = \int_{0}^{t} dt, \] (19)

The operating with the operator \( L^{-1} \) on both sides of Eq. (18) we have

\[ u = f_0 + L^{-1}(g(t) - R(u) - F(u)), \] (20)

where \( f_0 \) is the solution of homogeneous equation

\[ Lu = 0, \] (21)

involving the constants of integration. The integration constants involved in the solution of homogeneous equation (21) are to be determined by the initial or boundary condition according as the problem is initial-value problem or boundary-value problem. The ADM assumes that the unknown function \( u(x,t) \) can be expressed by an infinite series of the form

\[ u(x,t) = \sum_{n=0}^{\infty} u_n(x,t), \] (22)

and the nonlinear operator \( F(u) \) can be decomposed by an infinite series of polynomials given by

\[ F(u) = \sum_{n=0}^{\infty} A_n, \] (23)

where \( u_n(x,t) \) will be determined recurrently, and \( A_n \) are the so-called polynomials of \( u_0, u_1, \ldots, u_n \) defined by

\[ A_n = \frac{1}{n!} \frac{d^n}{d\lambda^n} \left[ F\left( \sum_{n=0}^{\infty} \lambda^n u_n \right) \right]_{\lambda=0}, \quad n = 0,1,2... \] (24)

3 Basic idea of He’s variational iteration method

To clarify the basic ideas of VIM, we consider the following differential equation:

\[ Lu + Nu = g(t), \] (25)

where \( L \) is a linear operator, \( N \) a nonlinear operator and \( g(t) \) an inhomogeneous term. According to VIM, we can write down a correction functional as follows:

\[ u_{n+1}(t) = u_n(t) + \int_{0}^{t} \lambda(Lu_n + Nu_n - g(t))d\tau, \] (26)

where \( \lambda \) is a general Lagrangian multiplier which can be identified optimally via the variation theory. The subscript \( n \) indicates the \( n \)th approximation and \( \tilde{u}_n \) is considered as a restricted variation \( \delta \tilde{u}_n = 0 \).

4 ADM implement for first model of shallow water wave equation
We first consider the application of ADM to first model of shallow water wave equation. If Eq. (2) is dealt with this method, it is formed as

\[ L_u = L_{x x}u + 4uL_u + 2L_xu \int^x L_u dx - L_xu, \tag{27} \]

where

\[ L_t = \frac{\partial}{\partial t}, \quad L_x = \frac{\partial}{\partial x}, \quad L_{x x} = \frac{\partial^3}{\partial x^2 \partial t}, \tag{28} \]

If the invertible operator \( L_t^{-1} = \int_0^t (\cdot) dt \) is applied to Eq. (27), then

\[ L_t^{-1}L_u = L_t^{-1}(L_{x x}u + 4uL_u + 2L_xu \int^x L_u dx - L_xu), \tag{29} \]

is obtained. By this

\[ u(x,t) = u(x,0) + L_t^{-1}(L_{x x}u + 4uL_u + 2L_xu \int^x L_u dx - L_xu), \tag{30} \]

is found. Here the main point is that the solution of the decomposition method is in the form of

\[ u(x,t) = \sum_{n=0}^\infty u_n(x,t), \tag{31} \]

Substituting from Eq. 31 in 30, we find

\[ \begin{aligned}
   \sum_{n=0}^\infty u_n(x,t) &= u(x,0) + \\
   L_t^{-1} &\left\{ L_{x x} \left( \sum_{n=0}^\infty u_n(x,t) \right) + \\
   4 \left( \sum_{n=0}^\infty u_n(x,t) \right) L_x &\left( \sum_{n=0}^\infty u_n(x,t) \right) + \\
   2L_x &\left( \sum_{n=0}^\infty u_n(x,t) \right) \int^x L_x \left( \sum_{n=0}^\infty u_n(x,t) \right) dx \\
   - L_x &\left( \sum_{n=0}^\infty u_n(x,t) \right) \right\} 
\end{aligned} \tag{32} \]

is found.

According to Eq. (19) approximate solution can be obtained as follows

\[ u(x,t) = u_0(x,t) + \frac{(c-1)\sec h^2 \left( 1 \frac{1}{2 \sqrt{c-1} x} \right)}{2c}, \tag{33} \]

\[ u_1(x,t) = \frac{(c-1)\sinh \left( 1 \frac{1}{2 \sqrt{c-1} x} \right) \cosh \left( 1 \frac{1}{2 \sqrt{c-1} x} \right)}{2c}, \tag{34} \]

\[ u_2(x,t) = \int_0^x \left( L_{x x}u_1 + 4u_1L_u + 2L_xu_1 \int^x L_u dx - L_xu_1 \right) dt, \tag{35} \]

Thus the approximate solution for first model of shallow water wave equation is obtained as

\[ u(x,t) = u_0(x,t) + u_1(x,t) + u_2(x,t), \tag{36} \]

The terms \( u_0(x,t), u_1(x,t), u_2(x,t) \) in Eq. (36), obtained from Eqs. (33), (34), (35).

5 \textbf{VIM implement for first model of shallow water wave equation}

Now let us consider the application of VIM for first model of shallow water wave equation with the initial condition of:

\[ u(x,0) = \frac{(c-1)\sec h^2 \left( 1 \frac{c-1}{2 \sqrt{c-1} x} \right)}{2c}, \tag{37} \]

Its correction variational functional in \( x \) and \( t \) can be expressed, respectively, as follows:

\[ \begin{aligned}
   u_{n+1}(x,t) &= u_n(x,t) + \\
   \int_0^x &\left\{ \frac{\partial u_n(x,\tau)}{\partial \tau} - \frac{\partial^3 u_n(x,\tau)}{\partial x^3 \partial \tau} \\
   - 4u_n(x,\tau) \frac{\partial u_n(x,\tau)}{\partial \tau} - \frac{\partial^2 u_n(x,\tau)}{\partial \tau^2} + \frac{\partial u_n(x,\tau)}{\partial \tau} \right\} \left( \frac{\partial u_n(x,\tau)}{\partial \tau} - \frac{\partial^3 u_n(x,\tau)}{\partial x^3 \partial \tau} \\
   + 2 \frac{\partial u_n(x,\tau)}{\partial \tau} \int_0^x &\left( \frac{\partial^2 u_n(x,\tau)}{\partial \tau^2} + \frac{\partial u_n(x,\tau)}{\partial \tau} \right) d\tau \right\} \right\} d\tau 
\end{aligned} \tag{38} \]
where $\lambda$ is general Lagrangian multiplier. After some calculations, we obtain the following stationary conditions:

$$\lambda'(\tau) = 0,$$  

(39a)

$$1 + \lambda(\tau)|_{\tau=0} = 0,$$  

(39b)

Thus we have:

$$\lambda(t) = -1,$$  

(40)

As a result, we obtain the following iteration formula:

$$u_{n+1}(x,t) = u_n(x,t) - \int_0^t \left[ \frac{\partial u_n(x,\tau)}{\partial \tau} - \frac{\partial^3 u_n(x,\tau)}{\partial x^2 \partial \tau} \right] d\tau - 4u_n(x,t) \int_0^t \frac{\partial u_n(\delta,\tau)}{\partial \tau} d\delta + 2 \int_0^t \frac{\partial u_n(\delta,\tau)}{\partial \tau} d\delta \int_0^t \frac{\partial u_n(x,\tau)}{\partial x} \right] d\tau,$$  

(41)

We start with the initial approximation of $u(x,0)$ given by Eq. (37). Using the above iteration formula (41), we can directly obtain the other components as follows:

$$u_0(x,t) = \frac{(c-1) \sec h \left( \frac{1}{2} \sqrt{\frac{c-1}{c}} x \right)}{2c},$$  

(42)

$$u_1(x,t) = \frac{(c-1) \sinh \left( \frac{1}{2} \sqrt{\frac{c-1}{c}} x \right)}{2c \cosh \left( \frac{1}{2} \sqrt{\frac{c-1}{c}} x \right)},$$  

(43)

$$u_2(x,t) = u_1(x,t)$$  

$$+ \int_0^t \left[ \frac{\partial u_1(x,\tau)}{\partial \tau} - \frac{\partial^3 u_1(x,\tau)}{\partial x^2 \partial \tau} \right] d\tau - 4u_1(x,t) \int_0^t \frac{\partial u_1(\delta,\tau)}{\partial \tau} d\delta + 2 \int_0^t \frac{\partial u_1(\delta,\tau)}{\partial \tau} d\delta \int_0^t \frac{\partial u_1(x,\tau)}{\partial x} \right] d\tau,$$  

(44)

If we assume $c=2$ then by drawing 3-D and 2-D figures of ADM and VIM solutions, we see those figures are similar to each other (Fig. 1, Fig. 2).

### 6 ADM implement for second model of shallow water wave equation

Now we consider the application of ADM to second model of shallow water wave equation. If Eq. (3) is dealt with this method, it is formed as

$$L_i u = L_{ssx} u + 3u L_i u + 3L_i u \int L_i L_i u dx - L_i u,$$  

(45)

where

$$L_i = \frac{\partial}{\partial t}, \quad L_x = \frac{\partial}{\partial x}, \quad L_{ssx} = \frac{\partial^3}{\partial x^2 \partial t}.$$  

(46)

If the invertible operator $L_i^{-1} = \int_0^t \frac{1}{L_i} dt$ is applied to Eq. 45, then

$$L_i^{-1} L_i u = L_i^{-1} (L_{ssx} u + 3u L_i u + 3L_i u \int L_i L_i u dx - L_i u),$$  

(47)

is obtained. By this

$$u(x,t) = u(x,0) + L_i^{-1} (L_{ssx} u + 3u L_i u + 3L_i u \int L_i L_i u dx - L_i u),$$  

(48)
is found. Here the main point is that the solution of the decomposition method is in the form of

$$u(x,t) = \sum_{n=0}^{\infty} u_n(x,t), \quad (49)$$

Substituting from Eq. 49 in 48, we find

$$\sum_{n=0}^{\infty} u_n(x,t) = u(x,0) + \left[ L_{x\tau} \left( \sum_{n=0}^{\infty} u_n(x,t) \right) + 3 \left( \sum_{n=0}^{\infty} u_n(x,t) \right) L \left( \sum_{n=0}^{\infty} u_n(x,t) \right) + \int L_i \left( \sum_{n=0}^{\infty} u_n(x,t) \right) dt \right], \quad (50)$$

$$L_i^{-1} \left( \sum_{n=0}^{\infty} u_n(x,t) \right) \int L_i \left( \sum_{n=0}^{\infty} u_n(x,t) \right) dx,$$

$$- \int \left( \sum_{n=0}^{\infty} u_n(x,t) \right) dx$$

is found.

According to Eq. 19 approximate solution can be obtained as follows:

$$u_0(x,t) = \frac{(c-1) \sec h^2 \left( \frac{1}{2c} \sqrt{\frac{c-1}{c}} x \right)}{2c}, \quad (51)$$

$$u_1(x,t) = \frac{(c-1) \sinh \left( \frac{1}{2c} \sqrt{\frac{c-1}{c}} x \right) \sqrt{\frac{c-1}{c}} t}{2c \cosh \left( \frac{1}{2c} \sqrt{\frac{c-1}{c}} x \right)}, \quad (52)$$

$$u_2(x,t) = \int_0^t (L_{x\tau} u_1 + 3 u_1 L u_1) + 3 \int L_i u_1 dx - L_i u_1) dt, \quad (53)$$

Thus the approximate solution for second model of shallow water wave equation is obtained as

$$u(x,t) = u_0(x,t) + u_1(x,t) + u_2(x,t), \quad (54)$$

The terms $u_0(x,t), u_1(x,t), u_2(x,t)$ in Eq. (54), obtained from Eqs. (51), (52), (53).

### 7 VIM implement for second model of shallow water wave equation

Here we consider the application of VIM for second model of shallow water wave equation with the initial condition of:

$$u(x,0) = \frac{(c-1) \sec h^2 \left( \frac{1}{2c} \sqrt{\frac{c-1}{c}} x \right)}{2c}, \quad (55)$$

Its correction variational functional in $x$ and $t$ can be expressed, respectively, as follows

$$u_{n+1}(x,t) = u_n(x,t)$$

$$\int_0^t \left( \frac{\partial u_n(x,\tau)}{\partial \tau} - \frac{\partial^3 u_n(x,\tau)}{\partial x^2 \partial \tau} \right) d\tau,$$

$$+ \int_0^t \left( -3u_n(x,\tau) \frac{\partial u_n(x,\tau)}{\partial \tau} - \frac{\partial^3 u_n(x,\tau)}{\partial x \partial \tau} \right) d\tau,$$

$$+ \int_0^t \left( 3 \frac{\partial u_n(x,\tau)}{\partial x} \right) d\tau$$

$$\lambda' (\tau) = 0,$$ \quad (57a)

$$+ \lambda \left. \tau \right|_{\tau=0} = 0,$$ \quad (57b)

Thus we have:

$$\lambda(t) = -1,$$ \quad (58)

As a result, we obtain the following iteration formula
\[ u_{n+1}(x,t) = u_n(x,t) \]

\[
\begin{bmatrix}
\frac{\partial u_n(x, \tau)}{\partial \tau} - \frac{\partial^3 u_n(x, \tau)}{\partial x^2 \partial \tau} \\
-3u_n(x, \tau) \frac{\partial u_n(x, \tau)}{\partial \tau} - \\
3 \frac{\partial u_n(x, \tau)}{\partial x} \int_0^\tau \frac{\partial u_n(\delta, \tau)}{\partial \tau} d\delta \\
\end{bmatrix} + \frac{\partial u_n(x, \tau)}{\partial x}
\]

(59)

We start with the initial approximation of \( u(x,0) \) given by Eq. (55). Using the above iteration formula (59), we can directly obtain the other components as follows

\[ u_0(x,t) = \frac{(c-1) \sec^2 \left( \frac{1}{2} \sqrt{\frac{c-1}{c}} x \right)}{2c} \]  

(60)

\[ u_1(x,t) = \frac{(c-1) \cosh \left( \frac{1}{2} \sqrt{\frac{c-1}{c}} x \right) + \sinh \left( \frac{1}{2} \sqrt{\frac{c-1}{c}} x \right) \sqrt{\frac{c-1}{c}} t}{2c \cosh^2 \left( \frac{1}{2} \sqrt{\frac{c-1}{c}} x \right)}, \]  

(61)

\[ u_2(x,t) = u_1(x,t) \]

\[
\begin{bmatrix}
\frac{\partial u_1(x, \tau)}{\partial \tau} - \frac{\partial^3 u_1(x, \tau)}{\partial x^2 \partial \tau} \\
-3u_1(x, \tau) \frac{\partial u_1(x, \tau)}{\partial \tau} - \\
3 \frac{\partial u_1(x, \tau)}{\partial x} \int_0^\tau \frac{\partial u_1(\delta, \tau)}{\partial \tau} d\delta \\
\end{bmatrix} + \frac{\partial u_1(x, \tau)}{\partial x}
\]

(62)

If we assume \( c=2 \) then by drawing 3-D and 2-D figures of ADM and VIM solutions, we see those figures are similar to each other (Fig.3, Fig.4).

8 ADM implement for first extended model of shallow water wave equation

We consider the application of ADM to first extended model of shallow water wave equation. If Eq. (14) is dealt with this method, it is formed as

\[ L_u = L_{xu}u + 4uL_1u + 2L_xu \int_0^t L_ud\tau \]

\[ -L_u - L_{xu}u - 6uL_1u, \]  

(63)

where

\[ L_t = \frac{\partial}{\partial t}, \quad L_x = \frac{\partial}{\partial x}, \quad L_{xu} = \frac{\partial^3}{\partial x^2 \partial t}, \]  

(64)

If the invertible operator \( L_t^{-1} = \int_0^t (\cdot) dt \) is applied to Eq. (63), then

\[ L_t^{-1}L_u = L_t^{-1}(L_{xu}u + 4uL_1u + 2L_xu \int L_ud\tau - L_u - L_{xu}u - 6uL_1u), \]  

(65)

is obtained. By this

\[ u(x,t) = u(x,0) + L_t^{-1}(L_{xu}u + 4uL_1u + 2L_xu \int L_ud\tau - L_u - L_{xu}u - 6uL_1u) \]  

(66)

is found. Here the main point is that the solution of the decomposition method is in the form of

\[ u(x,t) = \sum_{n=0}^{\infty} u_n(x,t), \]  

(67)

Substituting from Eq. (67) in (66), we find
\[
\sum_{n=0}^{\infty} u_n(x,t) = u(x,0) + \left( L_{xx} \left( \sum_{n=0}^{\infty} u_n(x,t) \right) + 4 \left( \sum_{n=0}^{\infty} u_n(x,t) \right) L_t \left( \sum_{n=0}^{\infty} u_n(x,t) \right) + 2 L_t \left( \sum_{n=0}^{\infty} u_n(x,t) \right) \right)
\]

\[
L_t^{-1} \int_{0}^{\infty} L_t \left( \sum_{n=0}^{\infty} u_n(x,t) \right) dx = L_{xx} \left( \sum_{n=0}^{\infty} u_n(x,t) \right) - L_t \left( \sum_{n=0}^{\infty} u_n(x,t) \right) - L_{xxx} \left( \sum_{n=0}^{\infty} u_n(x,t) \right) - 6 \left( \sum_{n=0}^{\infty} u_n(x,t) \right) L_t \left( \sum_{n=0}^{\infty} u_n(x,t) \right)
\]

is found.

According to Eq.(19) approximate solution can be obtained as follows:

\[
u_0(x,t) = \frac{(c-1) \sec h \left[ \frac{1}{2} \sqrt{\frac{c-1}{c+1}} \right]}{2c+2}, \quad (69)
\]

\[
u_1(x,t) = \frac{\sinh \left[ \frac{1}{2} \sqrt{\frac{c-1}{c+1}} \right] - c(c-1)}{\cosh \left[ 1 \sqrt{\frac{c-1}{c+1}} \right] (c+1)^2}, \quad (70)
\]

\[
u_2(x,t) = \int_{0}^{x} \left( L_{xx} u_1 + 4 u_1 L_t u_1 \right) + 2 L_t u_1 \int_{0}^{x} L_t u_1 dx - L_t u_1 - L_{xxx} u_1 - 6 u_1 L_t u_1 dt, \quad (71)
\]

Thus the approximate solution for first extended model of shallow water wave equation is obtained as

\[
u(x,t) = \nu_0(x,t) + \nu_1(x,t) + \nu_2(x,t), \quad (72)
\]

The terms \(\nu_0(x,t), \nu_1(x,t), \nu_2(x,t)\) in Eq.(72), obtained from Eqs.(69), (70), (71).

9 VIM implement for first extended model of shallow water wave equation

Now let us consider the application of VIM for first extended model of shallow water wave equation with the initial condition of

\[
u(x,0) = \frac{(c-1) \sec h \left[ \frac{1}{2} \sqrt{\frac{c-1}{c+1}} \right]}{2c+2}, \quad (73)
\]

Its correction variational functional in \(x\) and \(t\) can be expressed, respectively, as follows:

\[
u_{n+1}(x,t) = \nu_n(x,t) + \left[ \frac{\partial u_n(x,\tau)}{\partial \tau} - \frac{\partial^3 u_n(x,\tau)}{\partial x^2 \partial \tau} - 4 u_n(x,\tau) \frac{\partial^3 u_n(x,\tau)}{\partial \tau} - \frac{\partial^4 u_n(x,\tau)}{\partial \tau} + \frac{\partial^3 u_n(x,\tau)}{\partial x^3} + \frac{6 u_n(x,\tau) \partial^3 u_n(x,\tau)}{\partial \tau} \right] \frac{\partial^3 u_n(x,\tau)}{\partial \tau}
\]

\[
\int_{0}^{\tau} \lambda \frac{\partial u_n(x,\tau)}{\partial \tau} \int_{0}^{\tau} \frac{\partial^3 u_n(x,\tau)}{\partial \tau} d\delta \right] d\tau \quad (74)
\]

where \(\lambda\) is general Lagrangian multiplier. After some calculations, we obtain the following stationary conditions:

\[
\lambda'(\tau) = 0, \quad (75a)
\]

\[
1 + \lambda \bigg|_{\tau = t} = 0, \quad (75b)
\]

Thus we have

\[
\lambda(t) = -1, \quad (76)
\]
As a result, we obtain the following iteration formula:

\[ u_{n+1}(x,t) = u_n(x,t) \]

\[
\begin{align*}
&\left( \frac{\partial u_n(x,\tau)}{\partial \tau} - \frac{\partial^3 u_n(x,\tau)}{\partial x^2 \partial \tau} \\
&- 4u_n(x,\tau) \frac{\partial u_n(x,\tau)}{\partial \tau} - 2 \int_0^t \frac{\partial u_n(x,\tau)}{\partial x} \int_0^{\tau} \frac{\partial u_n(\sigma,\tau)}{\partial \tau} d\sigma d\tau \right) \\
&+ \frac{\partial u_n(x,\tau)}{\partial x} + \frac{\partial^3 u_n(x,\tau)}{\partial x^3} \\
&+ 6u_n(x,\tau) \frac{\partial u_n(x,\tau)}{\partial x}
\end{align*}
\]

\[ (77) \]

We start with the initial approximation of \( u(x,0) \) given by Eq. (73). Using the above iteration formula (77), we can directly obtain the other components as follows:

\[
u_0(x,t) = \frac{(c-1) \sec h^2 \left( \frac{1}{2} \frac{c-1}{c+1} x \right)}{2c+2} \]

\[ (78) \]

\[
u_1(x,t) = \frac{1}{\cosh^3 \left( \frac{1}{2} \frac{c-1}{c+1} x \right)} \left( c \cosh \left( \frac{1}{2} \frac{c-1}{c+1} x \right) \right) \]

\[
\left\{ \begin{array}{c}
\frac{1}{2} (c-1) \\
+ \cosh \left( \frac{1}{2} \frac{c-1}{c+1} x \right) \\
+ 2 \sinh \left( \frac{1}{2} \frac{c-1}{c+1} x \right) \cosh \left( \frac{1}{2} \frac{c-1}{c+1} x \right) \cosh \left( \frac{1}{2} \frac{c-1}{c+1} x \right)
\end{array} \right\} \]

\[ (79) \]

\[
u_2(x,t) = u_1(x,t) \]

\[
\begin{align*}
&\left( \frac{\partial u_1(x,\tau)}{\partial \tau} - \frac{\partial^3 u_1(x,\tau)}{\partial x^2 \partial \tau} \\
&- 4u_1(x,\tau) \frac{\partial u_1(x,\tau)}{\partial \tau} - 2 \int_0^t \frac{\partial u_1(x,\tau)}{\partial x} \int_0^{\tau} \frac{\partial u_1(\sigma,\tau)}{\partial \tau} d\sigma d\tau \right) \\
&+ \frac{\partial u_1(x,\tau)}{\partial x} + \frac{\partial^3 u_1(x,\tau)}{\partial x^3} \\
&+ 6u_1(x,\tau) \frac{\partial u_1(x,\tau)}{\partial x}
\end{align*}
\]

\[ (80) \]

If we assume \( c=2 \) then by drawing 3-D and 2-D figures of ADM and VIM solutions, we see those figures are similar to each other (Fig.5, Fig.6).

\section{10 ADM implement for second extended model of shallow water wave equation}

Here we consider the application of ADM to second extended model of shallow water wave equation. If Eq. (16) is dealt with this method, it is formed as

\[
L_i u = L_{xx_i} u + 3uL_i u + 3L_i u \int L_i u dx,
\]

\[ (81) \]

\[-L_s u - L_{xx_s} u - 6uL_s u\]

where

\[
L_i = \frac{\partial}{\partial t}, \quad L_s = \frac{\partial}{\partial x}, \quad L_{xx_s} = \frac{\partial^3}{\partial x^2 \partial t}, \quad L_{xxx} = \frac{\partial^3}{\partial x^3},
\]

\[ (82) \]

If the invertible operator \( L_i^{-1} = \int_0^t \cdot dt \) is applied to Eq. (81), then

\[
L_i^{-1} L_i u = L_i^{-1} (L_{xx_i} u + 3uL_i u + 3L_i u \int L_i u dx - L_s u - L_{xx_s} u - 6uL_s u),
\]

\[ (83) \]

is obtained. By this

\[
u(x,t) = u(x,0) + L_i^{-1} (L_{xx_i} u + 3uL_i u + 3L_i u \int L_i u dx - L_s u - L_{xx_s} u - 6uL_s u),
\]

\[ (84) \]

is found. Here the main point is that the solution of the decomposition method is in the form of

\[
u(x,t) = \sum_{n=0}^{\infty} u_n(x,\tau),
\]

\[ (85) \]

Substituting from Eq. (85) in (84), we find.
\[ \sum_{n=0}^{\infty} u_n(x,t) = u(x,0) + \]
\[ \left( \sum_{n=0}^{\infty} u_n(x,t) \right) + \]
\[ 3 \left( \sum_{n=0}^{\infty} u_n(x,t) \right) L_x \left( \sum_{n=0}^{\infty} u_n(x,t) \right) + \]
\[ 3L_x \left( \sum_{n=0}^{\infty} u_n(x,t) \right) \int_{0}^{t} L_x \left( \sum_{n=0}^{\infty} u_n(x,t) \right) dx \]
\[ - L_x \left( \sum_{n=0}^{\infty} u_n(x,t) \right) - L_{xx} \left( \sum_{n=0}^{\infty} u_n(x,t) \right) - 6 \left( \sum_{n=0}^{\infty} u_n(x,t) \right) L_x \left( \sum_{n=0}^{\infty} u_n(x,t) \right) \]

is found. According to Eq.(19) approximate solution can be obtained as follows

\[ u_0(x,t) = \frac{(c-1) \text{sech}^2 \left( \frac{1}{2 \sqrt{c+1}} x \right)}{2c+2} \]
\[ \text{sech} \left( \frac{1}{2 \sqrt{c+1}} x \right) \frac{c-1}{c+1} \]
\[ u_1(x,t) = \frac{\text{sech}^3 \left( \frac{1}{2 \sqrt{c+1}} x \right) (c+1)^2}{\cosh \left( \frac{1}{2 \sqrt{c+1}} x \right) (c+1)^2} \]
\[ u_2(x,t) = \int_{0}^{t} \left( L_{xx} u_1 + 3u_1 L_x u_1 + 3L_x u_1 \int_{0}^{t} L_x u_1 dx - L_x u_1 - L_{xx} u_1 \right) dt \]

Thus the approximate solution for second extended model of shallow water wave equation is obtained as
\[ u(x,t) = u_0(x,t) + u_1(x,t) + u_2(x,t) \]

The terms \( u_0(x,t), u_1(x,t), u_2(x,t) \) in Eq.(90), obtained from Eqs. (87), (88), (89).

### 11 VIM implement for second extended model of shallow water wave equation

At last we consider the application of VIM for second extended model of shallow water wave equation with the initial condition given by Eq.(73). Its correction variational functional in \( x \) and \( t \) can be expressed, respectively, as follows

\[ u_{n+1}(x,t) = u_n(x,t) \]
\[ \left( \frac{\partial u_n(x,t)}{\partial \tau} - \frac{\partial^3 u_n(x,t)}{\partial x^2 \partial \tau} - 3u_n(x,t) \frac{\partial u_n(x,t)}{\partial \tau} \right) + \int_{0}^{t} \lambda \left( -3 \frac{\partial u_n(x,t)}{\partial x} \int_{0}^{t} \frac{\partial u_n(\delta,t)}{\partial \delta} d\delta + \left( \frac{\partial u_n(x,t)}{\partial x} + \frac{\partial^3 u_n(x,t)}{\partial x^3} + 6u_n(x,t) \frac{\partial u_n(x,t)}{\partial x} \right) \right) d\tau \]

where \( \lambda \) is general Lagrangian multiplier. After some calculations, we obtain the following stationary conditions

\[ \lambda(\tau) = 0, \]  
\[ 1 + \lambda(\tau)|_{\tau=0} = 0, \]

Thus we have

\[ \lambda(t) = -1, \]

As a result, we obtain the following iteration formula
\begin{align}
\dot{u}_{n+1}(x,t) &= u_n(x,t) \\
&= \left( \frac{\partial u_n(x,\tau)}{\partial \tau} - \frac{\partial^3 u_n(x,\tau)}{\partial^3 \tau} \\
&- 3u_n(x,\tau) \frac{\partial^2 u_n(x,\tau)}{\partial \tau} - \frac{\partial^3 u_n(x,\tau)}{\partial^2 \tau} \\
&+ 6u_n(x,\tau) \frac{\partial^2 u_n(x,\tau)}{\partial \tau} \right) \\
&- \int_0^t \frac{\partial u_n(x,\tau)}{\partial \tau} \int_0^\tau \frac{\partial u_n(\delta,\tau)}{\partial \tau} \, d\delta \, d\tau
\end{align}

(94)

We start with the initial approximation of \( u(x,0) \) given by Eq. (73). Using the above iteration formula (94), we can directly obtain the other components as follows

\begin{align}
\dot{u}_0(x,t) &= \left( c-1 \right) \sec^2 \left( \frac{1}{2} \sqrt{\frac{c-1}{c+1}} \frac{x}{c+2} \right) \\
\dot{u}_1(x,t) &= \left( \cosh \left( \frac{1}{2} \sqrt{\frac{c-1}{c+1}} \frac{x}{c+1} \right) \right) \left( c-1 \right) \cosh \left( \frac{1}{2} \sqrt{\frac{c-1}{c+1}} \frac{x}{c+1} \right) \left( c+1 \right)^2 \\
&+ \cosh \left( \frac{1}{2} \sqrt{\frac{c-1}{c+1}} \frac{x}{c+1} \right) \\
&+ 2 \sinh \left( \frac{1}{2} \sqrt{\frac{c-1}{c+1}} \frac{x}{c+1} \right) \sqrt{\frac{c-1}{c+1}} \\
&+ 2 \sinh \left( \frac{1}{2} \sqrt{\frac{c-1}{c+1}} \frac{x}{c+1} \right) \sqrt{\frac{c-1}{c+1}}
\end{align}

(95)

\begin{align}
\dot{u}_2(x,t) &= \left( \frac{\partial u_1(x,\tau)}{\partial \tau} - \frac{\partial^3 u_1(x,\tau)}{\partial^3 \tau} \\
&- 3u_1(x,\tau) \frac{\partial^2 u_1(x,\tau)}{\partial \tau} - \frac{\partial^3 u_1(x,\tau)}{\partial^2 \tau} \\
&+ 6u_1(x,\tau) \frac{\partial^2 u_1(x,\tau)}{\partial \tau} \right) \\
&- \int_0^t \frac{\partial u_1(x,\tau)}{\partial \tau} \int_0^\tau \frac{\partial u_1(\delta,\tau)}{\partial \tau} \, d\delta \, d\tau
\end{align}

(97)

If we assume \( c=2 \) then by drawing 3-D and 2-D figures of ADM and VIM solutions, we see those figures are similar to each other (Fig. 7, Fig. 8).

\section*{12 Conclusion}

In this paper, Adomian’s decomposition and He’s variational iteration methods have been successfully applied to find the solution of two model equations for shallow water waves and their extended models. In addition, we compared these two methods to each other and showed that the results of the VIM method are in excellent agreement with results of ADM method. Also the obtained results were showed graphically. In our work; we used the Maple Package to calculate the functions obtained from the Adomian’s decomposition method and He’s variational iteration method.
Fig. 1. For the first model of shallow water wave equation with the first initial condition (33) of Eq. (2), ADM result for $u(x,t)$ is, respectively (1a) and VIM result (1b), when $c=2$.
