

This system and its Interoperability Strategy is focused in time optimization, profitability, productivity and cost saving for utility in terms of user visibility, agile information analysis, optimal information exchange, ability to implement new and advance functions, systems synergy and minimization of interfaces maintenance.

Future work is focused in more enterprise systems integration, like OMS, CRM, DMS, MWFM, among others, in order to obtain more benefits of this strategy; additionally, Business Process Management (BPM) will be used to integrate a modeling strategy, next solution under definition implies an integral management of failures and software tools for analysis and prevention as well as, a multidimensional database for OLAP.
