5 Conclusion

The overview of this project is to highlight the modern administrative practices for the implementation of contemporary policies, related to the dealing with crises and emergencies with the help of useful means offered by technology. An attempt has been made to apply the theory concerning the reorganizing of the business procedure of aerial search and rescue by using the information tool Bizagi Process Modeler. This attempt aims at creating a model and a pattern of the procedure and most specifically the complicated aspect of an operation where the points with problems become clear and easy to understand; in this way solutions for its improvement will be suggested.

By using the information tool Bizagi Process Modeler, the depiction is achievable and may be easily and quickly understood by all the bodies involved. In addition, with the help of Time Analysis being in progress and the Simulation, the possibility of elaborating the results for the aver-age time of caring out a complicated operation is offered. This attempt could be fundamental for further elaboration of clues in a procedure, which are not analyzed in this project, because of lack of time; these clues might be the reduction of cost, analysis of the recourses to be used, creation of scenarios and calendar analysis suggested applying by the same tool.
